“Energy Transition from Distribution System Operators, Salzburg Netz GmbH, Perspective”

The ongoing energy transition towards a sustainable society, i.e. accelerated electrification, is driving the transition of the electrical power system as we know it today. What are the challenges, solutions already on the table and in discussion, e.g. addressed due to research projects. Therefore, it is important to know the key players and their roles in the energy market and in the electrical power system operation.

The question to be addressed is, what does the energy transition mean for the electrical power system, especially for a distribution system operator like Salzburg Netz GmbH in the short-, medium- and long-term perspective. Hence, what is the actual state of the energy transition in Salzburg and how are the challenges addressed and managed by Salzburg Netz GmbH?
